Group Vision Web App Testing Report

I liked the features and the colors of your program. The usability was really simple, and it was really easy to understand how your app worked. I would recommend making the main feature of finding other people on the system to work. I would also recommend making directions to help people who may not understand how your app works.

by Andy Tong

In response to Andy Tong, I developed the main location features of the program so that they would work consistently. I made the UI much more intuitive so that people would understand how the app works. For example, I made sure the 4-digit group code more prominent, and added alerts to help guide people through the app so that they would know if they entered in a right group code.

Your app is very good! I think that you should add a description on the homepage in order to make the app a bit more intuitive. Also, I think you should make it stop tracking my location after I leave the group. Some other suggestions are that you should make a hover notification on the edit name as well as make it able to leave a group or be in two groups at once. Overall, I think your app is very good, it just would be good to add more features.

by Leni Rohe

In response to Leni, I fixed the bug where the location was still being tracked after the user leaves the group. I also made the app much more optimized so it would be more efficient when receiving the admin data, reading the group locations, etc. I really like the idea of adding descriptions and some titles on the homepage, especially for adding "Change Username" with an arrow pointing to the pencil button. I added all the leave group functionality so that fixes both the bug and the data in firebase. I like the idea of being in two groups at once, and might add that soon.
